Veneers

Veneers are custom-made coverings that fit over the front surfaces of teeth and can significantly improve the appearance of your smile.

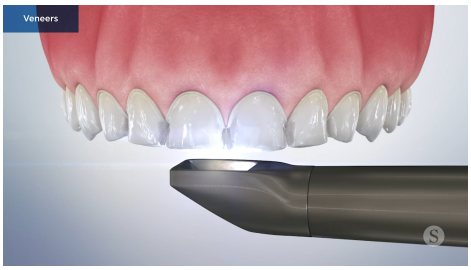

Your doctor may recommend veneers if your teeth are cracked, chipped, stained, or have other imperfections.

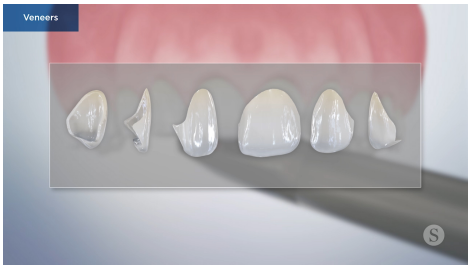

Veneers help restore your teeth's shape, function, and appearance.

At the first appointment, a numbing agent is applied to the area, and the teeth are prepared.

Then using an intraoral scanner, the prepared teeth are imaged to aid in the design of the veneers.

The images and information are sent to a dental laboratory, where an expert technician will fabricate your custom veneers.

A temporary is placed over the prepared teeth to protect them while you wait for the custom restorations to be made.

When your veneers are ready, your doctor removes the temporary, makes final adjustments and bonds them into place.

Once completed, your teeth are restored to optimal shape, function, and appearance.
